BASIC UNDERSTANDING ON FREE AND OPEN SOURCE SOFTWARE.

1) Describe open source software with example.

= Open source software is a software which source code that anyone can inspect, modify, and enhance. source code is the part of the software that most computer users don't ever see; it's the code computer programmers can manipulate to change how a piece of software, a program or application works. programmers who have access to a computer program's source code can improve that program by adding features to it or fixing parts that don't always work correctly.

EXAMPLE:

Prime examples of open source products are the APACHE HTTP server, the e-commerce platform os commerce, internet browsers mozilla firefox and chromium (the project where the vast majority of development of the freeware google chrome is done) and the full office suite libreoffice.

2) Describe free software with example.

=Free software means software that respects users freedom and community. roughly it means that the users have the freedom to run, copy, dispute, study, change and improve the software. thus, free software is a matter of liberty not price.

EXAMPLE:

The free software directory maintains a large database of free-software packages. some of the best known examples include the linux kernel, the BSD and LINUX operation systems, the GNU compiler collection and C library; the MYSQL relational database; the apache web server; and the sendmail mail transport agent.
